Bayes theorem

$$p(\mathbf{t}|\mathbf{x}) = \frac{p(\mathbf{x}|\mathbf{t})p(\mathbf{t})}{p(\mathbf{x})} = \frac{p(\mathbf{x}|\mathbf{t})p(\mathbf{t})}{\int p(\mathbf{x}|\mathbf{t})p(\mathbf{t})d\mathbf{t}}$$

- x observed variables, t unobserved variables (latent variables/parameters);
- $ightharpoonup p(\mathbf{x}|\mathbf{t}) likelihood;$
- $p(\mathbf{x}) = \int p(\mathbf{x}|\mathbf{t})p(\mathbf{t})d\mathbf{t}$ evidence;
- ho(t) prior distribution, p(t|x) posterior distribution.

Posterior distribution

$$p(\theta|\mathbf{X}) = \frac{p(\mathbf{X}|\theta)p(\theta)}{p(\mathbf{X})} = \frac{p(\mathbf{X}|\theta)p(\theta)}{\int p(\mathbf{X}|\theta)p(\theta)d\theta}$$

Latent variable models (LVM)

$$p(\mathbf{x}|\boldsymbol{\theta}) = \int p(\mathbf{x}, \mathbf{z}|\boldsymbol{\theta}) d\mathbf{z} = \int p(\mathbf{x}|\mathbf{z}, \boldsymbol{\theta}) p(\mathbf{z}) d\mathbf{z}.$$

MLE problem for LVM

$$egin{aligned} oldsymbol{ heta}^* &= rg \max_{oldsymbol{ heta}} \log p(\mathbf{X}|oldsymbol{ heta}) = rg \max_{oldsymbol{ heta}} \sum_{i=1}^n \log p(\mathbf{x}_i|oldsymbol{ heta}) = rg \max_{oldsymbol{ heta}} \sum_{i=1}^n \log \int p(\mathbf{x}_i|\mathbf{z}_i,oldsymbol{ heta}) p(\mathbf{z}_i) d\mathbf{z}_i. \end{aligned}$$

Naive Monte-Carlo estimation

$$p(\mathbf{x}|\boldsymbol{\theta}) = \int p(\mathbf{x}|\mathbf{z}, \boldsymbol{\theta}) p(\mathbf{z}) d\mathbf{z} = \mathbb{E}_{p(\mathbf{z})} p(\mathbf{x}|\mathbf{z}, \boldsymbol{\theta}) pprox rac{1}{K} \sum_{k=1}^{K} p(\mathbf{x}|\mathbf{z}_k, \boldsymbol{\theta}),$$
 where $\mathbf{z}_k \sim p(\mathbf{z})$.

ELBO derivation 1 (inequality)

$$\log p(\mathbf{x}|\boldsymbol{\theta}) = \log \int p(\mathbf{x}, \mathbf{z}|\boldsymbol{\theta}) d\mathbf{z} \geq \mathbb{E}_q \log \frac{p(\mathbf{x}, \mathbf{z}|\boldsymbol{\theta})}{q(\mathbf{z})} = \mathcal{L}(q, \boldsymbol{\theta})$$

ELBO derivation 2 (equality)

$$\mathcal{L}(q, \theta) = \int q(\mathbf{z}) \log \frac{p(\mathbf{x}, \mathbf{z}|\theta)}{q(\mathbf{z})} d\mathbf{z} = \int q(\mathbf{z}) \log \frac{p(\mathbf{z}|\mathbf{x}, \theta)p(\mathbf{x}|\theta)}{q(\mathbf{z})} d\mathbf{z} = \\ = \log p(\mathbf{x}|\theta) - KL(q(\mathbf{z})||p(\mathbf{z}|\mathbf{x}, \theta))$$

Variational decomposition

$$\log p(\mathbf{x}|\boldsymbol{\theta}) = \mathcal{L}(q, \boldsymbol{\theta}) + KL(q(\mathbf{z})||p(\mathbf{z}|\mathbf{x}, \boldsymbol{\theta})) \geq \mathcal{L}(q, \boldsymbol{\theta}).$$

Variational lower Bound (ELBO)

$$\log p(\mathbf{x}|oldsymbol{ heta}) = \mathcal{L}(q,oldsymbol{ heta}) + \mathit{KL}(q(\mathbf{z})||p(\mathbf{z}|\mathbf{x},oldsymbol{ heta})) \geq \mathcal{L}(q,oldsymbol{ heta}).$$

$$\mathcal{L}(q, \theta) = \int q(\mathbf{z}) \log \frac{p(\mathbf{x}, \mathbf{z}|\theta)}{q(\mathbf{z})} d\mathbf{z} = \mathbb{E}_q \log p(\mathbf{x}|\mathbf{z}, \theta) - KL(q(\mathbf{z})||p(\mathbf{z}))$$

Log-likelihood decomposition

$$\log p(\mathbf{x}|\boldsymbol{\theta}) = \mathbb{E}_q \log p(\mathbf{x}|\mathbf{z},\boldsymbol{\theta}) - KL(q(\mathbf{z})||p(\mathbf{z})) + KL(q(\mathbf{z})||p(\mathbf{z}|\mathbf{x},\boldsymbol{\theta})).$$

Instead of maximizing incomplete likelihood, maximize ELBO

$$\max_{m{ heta}} p(\mathbf{x}|m{ heta}) \quad o \quad \max_{m{ heta},m{ heta}} \mathcal{L}(m{ heta},m{ heta})$$

 Maximization of ELBO by variational distribution q is equivalent to minimization of KL

$$rg \max_{q} \mathcal{L}(q, oldsymbol{ heta}) \equiv rg \min_{q} \mathit{KL}(q(\mathbf{z})||p(\mathbf{z}|\mathbf{x}, oldsymbol{ heta})).$$

Generative models zoo

Variational autoencoder (VAE)

Final EM-algorithm

- ▶ pick random sample \mathbf{x}_i , $i \sim U[1, n]$.
- compute the objective:

$$egin{aligned} oldsymbol{\epsilon}^* &\sim r(oldsymbol{\epsilon}); & \mathbf{z}^* = \mathbf{g}_{oldsymbol{\phi}}(\mathbf{x}, oldsymbol{\epsilon}^*); \end{aligned}$$
 $\mathcal{L}(oldsymbol{\phi}, oldsymbol{ heta}) pprox \log p(\mathbf{x}|\mathbf{z}^*, oldsymbol{ heta}) - \mathit{KL}(q(\mathbf{z}^*|\mathbf{x}, oldsymbol{\phi})||p(\mathbf{z}^*)). \end{aligned}$

lacktriangle compute a stochastic gradients w.r.t. ϕ and heta

$$abla_{\phi} \mathcal{L}(\phi, \theta) pprox
abla_{\phi} \log p(\mathbf{x}|\mathbf{g}_{\phi}(\mathbf{x}, \epsilon^*), \theta) -
abla_{\phi} \mathsf{KL}(q(\mathbf{z}|\mathbf{x}, \phi)||p(\mathbf{z})); \\
\nabla_{\theta} \mathcal{L}(\phi, \theta) pprox
abla_{\theta} \log p(\mathbf{x}|\mathbf{z}^*, \theta).$$

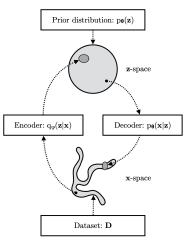

• update θ , ϕ according to the selected optimization method (SGD, Adam, etc):

$$\phi := \phi + \eta \cdot \nabla_{\phi} \mathcal{L}(\phi, \theta),$$

 $\theta := \theta + \eta \cdot \nabla_{\theta} \mathcal{L}(\phi, \theta).$

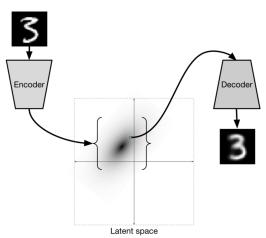

Variational autoencoder (VAE)

- VAE learns stochastic mapping between x-space, from complicated distribution π(x), and a latent z-space, with simple distribution.
- The generative model learns a joint distribution $p(\mathbf{x}, \mathbf{z}|\boldsymbol{\theta}) = p(\mathbf{z})p(\mathbf{x}|\mathbf{z}, \boldsymbol{\theta})$, with a prior distribution $p(\mathbf{z})$, and a stochastic decoder $p(\mathbf{x}|\mathbf{z}, \boldsymbol{\theta})$.
- The stochastic encoder $q(\mathbf{z}|\mathbf{x}, \phi)$ (inference model), approximates the true but intractable posterior $p(\mathbf{z}|\mathbf{x}, \theta)$ of the generative model.

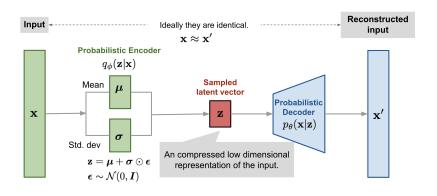

Variational Autoencoder

$$\mathcal{L}(\phi, oldsymbol{ heta}) = \mathbb{E}_{q(\mathbf{z}|\mathbf{x}, \phi)} \left[\log p(\mathbf{x}|\mathbf{z}, oldsymbol{ heta}) - \log rac{q(\mathbf{z}|\mathbf{x}, \phi)}{p(\mathbf{z})}
ight]
ightarrow \max_{\phi, heta}.$$

Variational autoencoder (VAE)

- Encoder $q(\mathbf{z}|\mathbf{x},\phi) = \mathsf{NN}_e(\mathbf{x},\phi)$ outputs $\mu_\phi(\mathbf{x})$ and $\sigma_\phi(\mathbf{x})$.
- ▶ Decoder $p(\mathbf{x}|\mathbf{z}, \boldsymbol{\theta}) = \mathsf{NN}_d(\mathbf{z}, \boldsymbol{\theta})$ outputs parameters of the sample distribution.

1. Variational autoencoder (VAE

2. Normalizing flows as VAE model

VAE vs Normalizing flows

	VAE	NF
Objective	ELBO $\mathcal L$	Forward KL/MLE
Encoder	stochastic $\mathbf{z} \sim q(\mathbf{z} \mathbf{x}, oldsymbol{\phi})$	$\begin{aligned} deterministic \\ \mathbf{z} &= \mathbf{f}_{\boldsymbol{\theta}}(\mathbf{x}) \\ q(\mathbf{z} \mathbf{x}, \boldsymbol{\theta}) &= \delta(\mathbf{z} - \mathbf{f}_{\boldsymbol{\theta}}(\mathbf{x})) \end{aligned}$
Decoder	$\begin{array}{c} stochastic \\ \mathbf{x} \sim p(\mathbf{x} \mathbf{z}, \boldsymbol{\theta}) \end{array}$	$\begin{aligned} & \text{deterministic} \\ & \mathbf{x} = \mathbf{g}_{\boldsymbol{\theta}}(\mathbf{z}) \\ & p(\mathbf{x} \mathbf{z}, \boldsymbol{\theta}) = \delta(\mathbf{x} - \mathbf{g}_{\boldsymbol{\theta}}(\mathbf{z})) \end{aligned}$
Parameters	$oldsymbol{\phi}, oldsymbol{ heta}$	$ heta \equiv \phi$

Theorem

MLE for normalizing flow is equivalent to maximization of ELBO for VAE model with deterministic encoder and decoder:

$$p(\mathbf{x}|\mathbf{z}, \boldsymbol{\theta}) = \delta(\mathbf{x} - \mathbf{f}_{\boldsymbol{\theta}}^{-1}(\mathbf{z})) = \delta(\mathbf{x} - \mathbf{g}_{\boldsymbol{\theta}}(\mathbf{z}));$$

$$q(\mathbf{z}|\mathbf{x}, \boldsymbol{\theta}) = \rho(\mathbf{z}|\mathbf{x}, \boldsymbol{\theta}) = \delta(\mathbf{z} - \mathbf{f}_{\boldsymbol{\theta}}(\mathbf{x})).$$

Nielsen D., et al. SurVAE Flows: Surjections to Bridge the Gap between VAEs and Flows. 2020

Normalizing flow as VAE

Proof

1. Dirac delta function property

$$\mathbb{E}_{\delta(\mathbf{x}-\mathbf{y})}\mathbf{f}(\mathbf{x}) = \int \delta(\mathbf{x}-\mathbf{y})\mathbf{f}(\mathbf{x})d\mathbf{x} = \mathbf{f}(\mathbf{y}).$$

2. CoV theorem and Bayes theorem:

$$p(\mathbf{x}|\boldsymbol{\theta}) = p(\mathbf{z})|\det(\mathbf{J_f})|;$$

$$p(\mathbf{z}|\mathbf{x},\boldsymbol{\theta}) = \frac{p(\mathbf{x}|\mathbf{z},\boldsymbol{\theta})p(\mathbf{z})}{p(\mathbf{x}|\boldsymbol{\theta})}; \quad \Rightarrow \quad p(\mathbf{x}|\mathbf{z},\boldsymbol{\theta}) = p(\mathbf{z}|\mathbf{x},\boldsymbol{\theta})|\det(\mathbf{J}_{\mathbf{f}})|.$$

3. Log-likelihood decomposition

$$\log p(\mathbf{x}|\boldsymbol{\theta}) = \mathcal{L}(\boldsymbol{\theta}) + \frac{KL(q(\mathbf{z}|\mathbf{x},\boldsymbol{\theta})||p(\mathbf{z}|\mathbf{x},\boldsymbol{\theta}))}{\mathcal{L}(\boldsymbol{\theta})} = \mathcal{L}(\boldsymbol{\theta}).$$

Normalizing flow as VAE

Proof

ELBO objective:

$$\mathcal{L} = \mathbb{E}_{q(\mathbf{z}|\mathbf{x},\boldsymbol{\theta})} \left[\log p(\mathbf{x}|\mathbf{z},\boldsymbol{\theta}) - \log \frac{q(\mathbf{z}|\mathbf{x},\boldsymbol{\theta})}{p(\mathbf{z})} \right]$$

$$= \mathbb{E}_{q(\mathbf{z}|\mathbf{x},\boldsymbol{\theta})} \left[\log \frac{p(\mathbf{x}|\mathbf{z},\boldsymbol{\theta})}{q(\mathbf{z}|\mathbf{x},\boldsymbol{\theta})} + \log p(\mathbf{z}) \right].$$

1. Dirac delta function property:

$$\mathbb{E}_{q(\mathbf{z}|\mathbf{x},\boldsymbol{\theta})}\log p(\mathbf{z}) = \int \delta(\mathbf{z} - \mathbf{f}_{\boldsymbol{\theta}}(\mathbf{x}))\log p(\mathbf{z})d\mathbf{z} = \log p(f_{\boldsymbol{\theta}}(\mathbf{x})).$$

2. CoV theorem and Bayes theorem:

$$\mathbb{E}_{q(\mathbf{z}|\mathbf{x},\theta)}\log\frac{p(\mathbf{x}|\mathbf{z},\theta)}{q(\mathbf{z}|\mathbf{x},\theta)} = \mathbb{E}_{q(\mathbf{z}|\mathbf{x},\theta)}\log\frac{p(\mathbf{z}|\mathbf{x},\theta)|\det(\mathbf{J_f})|}{q(\mathbf{z}|\mathbf{x},\theta)} = \log|\det\mathbf{J_f}|.$$

3. Log-likelihood decomposition

$$\log p(\mathbf{x}|\boldsymbol{\theta}) = \mathcal{L}(\boldsymbol{\theta}) = \log p(f_{\boldsymbol{\theta}}(\mathbf{x})) + \log |\det \mathbf{J}_{\mathbf{f}}|.$$

Summary

► The VAE model is an LVM with two neural network: stochastic encoder $q(\mathbf{z}|\mathbf{x}, \phi)$ and stochastic decoder $p(\mathbf{x}|\mathbf{z}, \theta)$.

▶ NF models could be treated as VAE model with deterministic encoder and decoder.
